## 7. Wartungsarbeiten an SMDs (Surface Mounted Devices)

### 7.1 Allgemeine Hinweise zu Umgang und Lagerung

- Oxidationen an den Anschlüssen der SMDs verursachen schlechte Lötverbindungen. Die Lötflächen nicht mit bloßen Händen berühren.
- Wegen Oxidationsgefahr bei der Lagerung Räume meiden, in denen Schwefel- oder Chlorgas, direkte Sonneneinstrahlung, hohe Temperaturen oder Feuchte auftreten.  
Der Kapazitäts- und/oder Widerstandswert der SMDs könnte dadurch beeinflusst werden.
- Unsachgemäße Behandlung von SMD-Leiterplatten kann zu Schäden an den Bauelementen und Leiterplatten führen. SMD-Leiterplatten dürfen nicht gebogen werden.  
Leiterplatten können unter dem Einfluß extremer Temperaturunterschiede schrumpfen oder sich ausdehnen. Bauelemente und/oder Lötverbindungen können durch infolgedessen auftretende Spannungen beschädigt werden.  
Zur Reinigung die SMDs niemals wischen oder scheuern. Dadurch kann sich der Wert des Bauelements ändern. Die SMD-Leiterplatte nicht über die Arbeitsfläche schieben.

### 7.2 Entfernen von SMDs

- Das Lötzinn an den Anschlüssen des SMDs 2 bis 3 Sekunden lang erhitzen. Kleine Bauelemente können mit Hilfe von Sauglitzendraht und geringer horizontaler Krafteinwirkung mit dem LötKolben entfernt werden. Die genannten Bauelemente können auch mit Hilfe eines Entlötgeräts (siehe Abb. 2A) entfernt werden, oder:
- Die Lötverbindungen des SMDs mit einem LötKolben erhitzen und mit einer Pinzette das Bauelement vorsichtig entfernen (siehe Abb. 2B).
- Überschüssiges Lötzinn an den Lötflächen mit Hilfe von Sauglitzendraht oder einem Entlötgerät entfernen (siehe Abb. 2C).

#### Achtung beim Entlöten:

- Bei der Verwendung eines LötKolbens nicht zu stark auf die Lötstelle drücken. Vorsicht beim Entlöten!
- Die SMDs nicht mit Hilfe einer Pinzette losbrechen.
- Der zu verwendende LötKolben (ca. 30 Watt) sollte möglichst mit einer Temperaturregung ausgestattet sein (Temperatur des LötKolbens: 225 - 250° C).
- Einmal entfernte SMDs dürfen nicht wiederverwendet werden.

Bild 2

### 7.3 Montieren von SMDs

- Das Bauelement mit Hilfe einer Pinzette auf der Lötfläche plazieren und auf einer Seite anlöten. Darauf achten, daß das Bauelement genau positioniert auf den Lötflächen liegt (Vgl. Abb. 3A).
- Anschließend die Anschlüsse des Bauelements festlöten (Vgl. Abb. 3B).

Bild. 3

#### Hinweise zur Montage

- Die zu lötenden Anschlüsse der SMDs niemals direkt mit dem LötKolben berühren. Der Lötvorgang sollte so kurz wie möglich sein. Darauf achten, daß die Anschlüsse der SMDs nicht beschädigt werden.
- Beim Löten muß das Bauelement stets Kontakt zur Leiterplatte haben.
- Der zu verwendende LötKolben (ca. 30 Watt) sollte möglichst mit einer Temperaturregung ausgestattet sein (Temperatur des LötKolbens: 225 - 250° C).
- Niemals außerhalb der Lötfläche löten.
- (Harzhaltige) Lötflußmittel dürfen verwendet werden; diese dürfen jedoch keine Säuren enthalten.
- Die Bauelemente nach dem Löten ausreichend abkühlen lassen.
- Die Lotmenge muß der Größe der Lötfläche entsprechen. Bei einer zu großen Menge könnte das Bauelement zerbrechen oder die Lötflächen könnten sich von der Leiterplatte lösen (Siehe Abb. 4).

Bild. 4

1. Ein zu reparierendes Gerät immer über einen Trenntransformator an das Netz anschließen.
2. Laut Sicherheitsvorschrift ist das Gerät wieder in den ursprünglichen Zustand zu bringen; außerdem dürfen nur Ersatzteile verwendet werden, die mit den ursprünglichen Bauteilen identisch sind. Die Sicherheitselemente sind mit dem Symbol **▲** gekennzeichnet.
3. Um Beschädigungen der ICs und Transistoren vorzubeugen, sind Überschlüsse der Hochspannung stets zu vermeiden. Um Schäden an der Bildröhre zu vermeiden, ist die in Abb. 1 dargestellte Methode zum Entladen der Bildröhre anzuwenden. Einen Hochspannungs-Meßgerät (Bereich DC-V) verwenden. Bildröhre entladen, bis das Meßgerät 0 V anzeigt (nach ca. 30 Sekunden).
4. Elektrostatische Entladungen (ESD)   
Sämtliche ICs und viele andere Halbleiter sind empfindlich gegen elektrostatische Entladungen. Eine unsorgfältige Behandlung bei der Reparatur kann die Lebensdauer drastisch verkürzen. Achten Sie darauf, daß Sie bei Reparaturarbeiten über ein Handgelenkband mit Schutzwiderstand mit dem gleichen Massepotential wie das Gerät verbunden sind. Bauelemente und Werkzeug müssen ebenfalls das gleiche Potential aufweisen.
5. Die verwendeten FSQ-Bildröhren bilden mit der Ablenkeinheit und einer eventuellen Multipoleinheit ein Ganzes. Die optimale Einstellung der Ablenk- und der Multipoleinheit wurde werkseitig vorgenommen. Von Einstellungen dieser Einheit bei Reparaturen wird daher abgeraten.
6. Das Hochspannungskabel wurde an den Zeilentransformator angeleimt und läßt sich daher nicht austauschen.
7. Vorsicht bei Messungen am Hochspannungsteil und an der Bildröhre.
8. Niemals Module oder andere Bauelemente austauschen, während das Gerät eingeschaltet ist.
9. Beim Austauschen der Bildröhre ist das Tragen einer Schutzbrille vorgeschrieben.
10. Zum Einstellen Plastik- statt Metallwerkzeuge benutzen, um Kurzschlüssen oder Instabilitäten bei bestimmten Schaltkreisen vorzubeugen.

## 1. Service-Default-Modus

Das Gerät ist mit einem sog. Service-Default-Modus (SDM) ausgestattet. Dieser Modus wird aktiviert, indem Pin 7 von IC7600 beim Einschalten des Geräts mit Masse verbunden wird. Bei aktiviertem SDM erscheint ein "S" auf dem Bildschirm. Der SDM wird verlassen, indem das Gerät auf Bereitschaft geschaltet oder ganz ausgeschaltet wird. Im Service-Default-Modus werden Lautstärke, Helligkeit, Kontrast und Farbsättigung auf einen Festwert eingestellt; außerdem schaltet sich das Gerät bei fehlendem Antennensignal nicht mehr selbsttätig aus.

2. Bei den Messungen der Gleichspannungen und Oszillogramme ist vom nächstgelegenen Erdungspunkt auf der Leiterplatte auszugehen.
3. Die Gleichspannungen und Oszillogramme wurden bei aktiviertem Service-Default-Modus gemessen. Als Eingangssignal wurde ein vom Bildmustergenerator PM5515 erzeugtes Farbbalkenmuster zugeführt.
4. Die Oszillogramme und Gleichspannungen wurden an den entsprechenden Meßpunkten mit  und ohne Antennensignal  gemessen. Die Spannungen im Netzteil wurden sowohl bei normalem Betrieb  als bei Bereitschaft  gemessen. Diese Werte werden durch die entsprechenden Symbole gekennzeichnet.
5. Die in den Listen aufgeführten Ersatzteile sind, ungeachtet der etwaigen Typenbezeichnungen, pro Position völlig identisch mit den im Gerät befindlichen Bauteilen.
6. Die Bildröhrenplatine ist mit aufgedruckten Funkenbahnen versehen. Jede der Funkenbahnen ist zwischen einer Elektrode der Bildröhre und der Aquadagschicht geschaltet.

## 1. Serviceposition

Um die Fehlersuche und Reparatur am Gerät zu erleichtern, läßt sich das Chassis, nachdem die Entmagnetisierungsspule gelöst wurde, aus dem Gehäuse herausziehen, um 180° drehen und hinter das Gerät plazieren (Siehe Abb. 5).

## 2. Halterung der FSQ-Bildröhre

### Ausbauen der Bildröhre:

Die Muttern der Bildröhrenhalterung mit Hilfe eines Steckschlüssels (10 mm) **rechtsherum** drehen und lösen (Siehe Abb. 6).

### Einbauen der Bildröhre:

Die Bolzen mit Hilfe eines Steckschlüssels (10 mm) **linksherum** in die Maske schrauben.

Die Bildröhre in die Maske einführen. Um diese Arbeit zu erleichtern, empfiehlt es sich, das Gehäuse mit der Vorderseite nach unten zu legen. Die Bildröhre in die Mitte der Maske einsetzen. Den Bolzen **rechtsherum** drehen, bis sich die Mutter auf den Bolzen schrauben läßt.

Die Mutter mit der Hand **linksherum** bis an die Bildhalterung schrauben.

Den Bolzen **rechtsherum** drehen, bis das Ganze festsetzt. (Die Mutter darf sich nicht mehr bewegen lassen.)
